

# Docker Networking

**VISHWANATH M S**

**VISHWACLOUDLAB.COM**

# Docker Default Networking

# Basic Commands

- \$ docker network ls

NETWORK ID	NAME	DRIVER
7fca4eb8c647	bridge	bridge
9f904ee27bf5	none	null
cf03ee007fb4	host	host

- The bridge network represents the docker0 network present in all Docker installations.

```
[root@docker-mas01 ~]# ifconfig | more
docker0: flags=4099<UP,BROADCAST,MULTICAST>  mtu 1500
        inet 172.17.0.1  netmask 255.255.0.0  broadcast 0.0.0.0
        ether 02:42:c7:98:c2:f4  txqueuelen 0  (Ethernet)
        RX packets 0  bytes 0 (0.0 B)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 0  bytes 0 (0.0 B)
        TX errors 0  dropped 0 overruns 0  carrier 0  collisions 0
```

# \$ docker network inspect bridge

```
[root@docker-mas01 ~]# docker network inspect bridge
[

```

# To Disable the default Bridge port Network

- Add the below in the “daemon.json” file to disable the use of Default Bridge port Network on the LINUX HOST.
  - ***“bridge”: “none”,***
  - ***“iptables”: “false”***
- ***Note: -- Don't forget to restart the docker service for the changes to be effected.***

# User-defined networks (UDN)

- User Defined networks are best suited in most cases,
- This gives better control over the network for controlling the communication between Containers.
- Docker provides default network drivers for creating the networks.
- There is NO limit to create the number of networks.
- Containers can be connected and disconnected to networks on the fly.
- **Note:** -- Since the Communication of Containers within the UDN is by default, using “**linking**” is not supported.

# Types of User-Defined Network (UDN)

- Bridge Networks
- Overlay network
- MACVLAN Network

# Bridge Networks - UDN

To create a new Bridge network

```
$ docker network create --driver bridge <<N/W Name>>
```

To Check the network

```
$ docker network inspect <<N/W Name>>
```

To launch the container with the new bridge network

```
$ docker run --network=<<N/w Name>> -itd --name=cont3 <<imageName>>
```

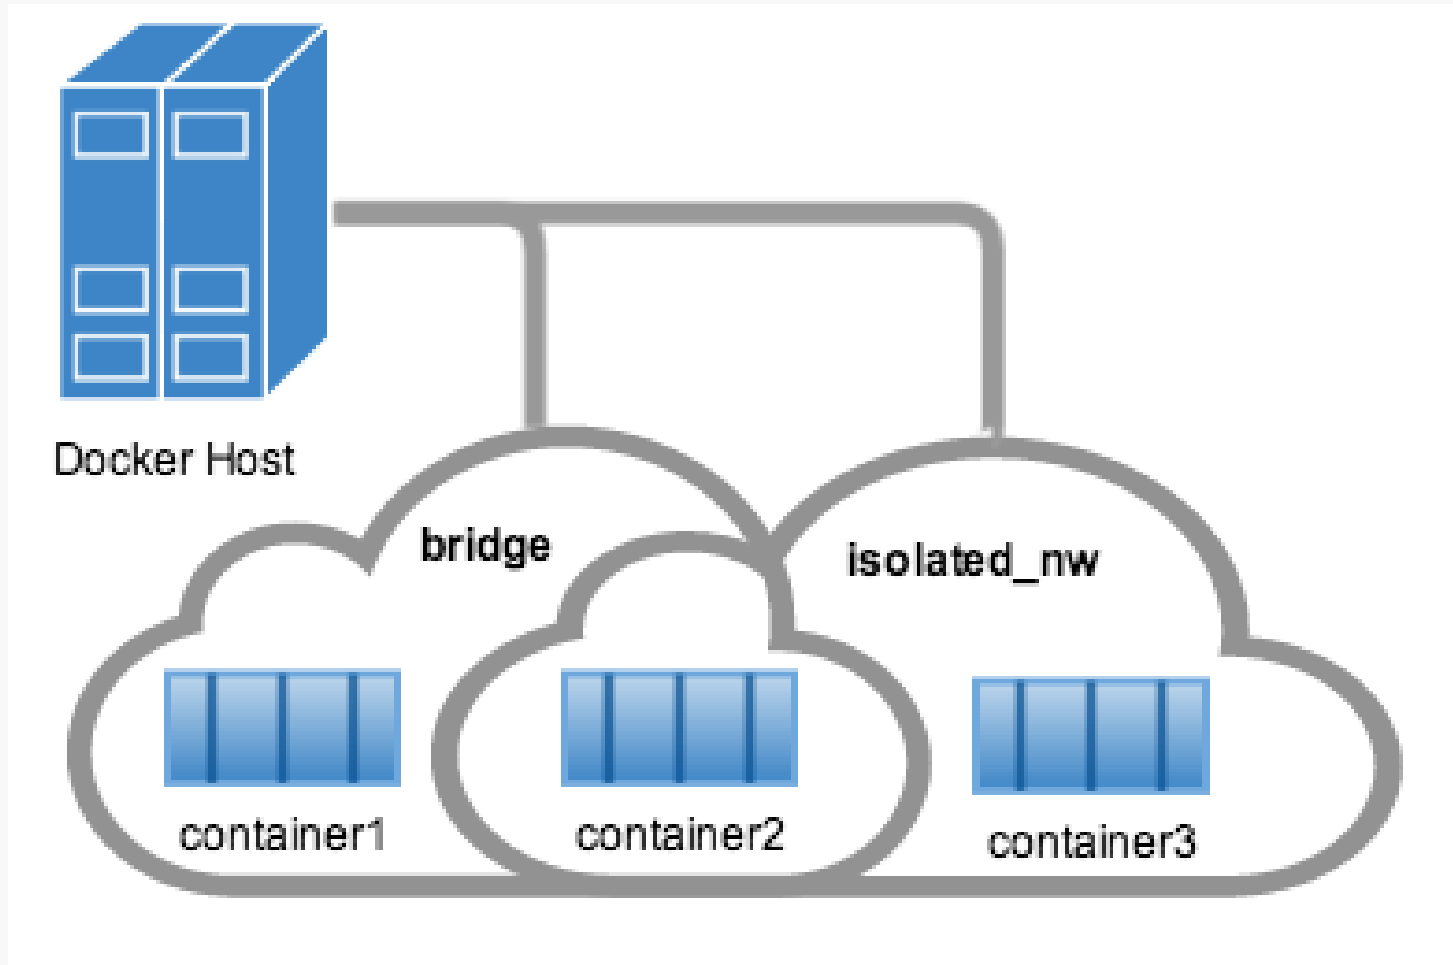

# More with network Commands

- \$ docker network create
- \$ docker network connect
- \$ docker network ls
- \$ docker network rm
- \$ docker network disconnect
- \$ docker network inspect

# Network connect and disconnect

- \$ docker network connect --ip <host ip to be reserved> <<n/w name>> <<containername>>
- \$ docker network disconnect <<n/w name>> <<containername>>
